

## Declaration of Conformity

**Ceramic bonded abrasives do not contain any substances of biological or animal origin.**

With this letter we confirm, with reference to the data sheets provided by our suppliers, the following information on the chemical composition of vitrified bonded abrasives. There are no biological or animal substances in the product you have purchased.

In the production of bonded ceramic abrasives, an abrasive grain combination is used which consists mainly of carbide and oxide groups. In the formulas, additives with mineral composition such as clay and silicate minerals can also be used. Due to the natural origin of the raw materials, trace elements in the ppm range cannot be completely excluded.

Due to the manufacturing process, no organic substances occur in vitrified bonded abrasives. In the sintering process at approx. 1000C° all organic substances burn up.
